# 197/10 AUXILIARY CONTROLS SPREAD IN THE CABIN

ELECTROMAGNETIC  
COMPATIBILITY  
TESTED

This device allows to control the auxiliary functions such as direction indicators, horn, lights, windscreen wiper and hazard lights by pressing some switches inside the car compartment. It's used by drivers with disabilities to both upper limbs. To install it, you need a car with automatic gear and power steering. It is a highly customized product since it allows to create "tailor made" solutions to be adjusted on the customer needs and on the car's features as best as it can. The direction indicators, for example, can be controlled by two switches placed on the headrest, one on the left and one on the right. To turn lights and wipers on, it is possible to adjust a thin keypad with some microswitches to be actioned by the elbow on the armrest. These controls can also be placed on the driver's door, by adding the ones for the rear windscreen wiper and the front washer. As an alternative, it is possible to install, on the floor, close to the driver's foot stand, a shaped plate with the above mentioned controls or only some of them. It will be always possible to use the original auxiliary controls, disconnecting the device by a switch placed in a comfortable position inside the car compartment.

Lights, Indicators

Windscreen-wipers
