

PARKING BRAKE AIDS

These aids are used by drivers with disabilities to the right arm or to both arms, on vehicles equipped with automatic gearshift and power steering.

FS503B

This device consists of an easily reachable led button located on the dash board that electrically controls the parking brake.

Activating and deactivating the brake is very simple and fast. After pressing the button the first time a red light will blink until the brake is completely applied. The brake can be released by pressing the same button a second time.

FFAM197

The device consists of a handle placed on the handbrake lever: a light pressure on the handle makes it easier to use the hand brake.
