

RM205 MANUAL TIP UP PLATE

The tip-up plate has been designed to make the car entrance and the car exit easier, both on the driver side and on the passenger side, on 2 and 4 doors cars. It can be also useful to transfer people who cannot use the legs, as a bridge between the car seat and the wheelchair. The maximum load is 120 Kg.

Without altering the general structure of the vehicle and without replacing the original seat, it can be considered a very fair device; by an inclination of 90°, it can be pulled down along the seat, and, when not used, folded behind the B-pillar, along the backrest.

When there is not enough room between the B-pillar and the seat, the tip-up plate is supplied as removable, not interfering with the inside of the vehicle (see picture on the left side).
