

PV1009/R & PV1009/R K-CAN TRANSMITTER ON THE WHEEL FOR AUXILIARY CONTROLS

This transmitter on the wheel for auxiliary functions joins the service controls in one station on the steering wheel, either on the right or the left, depending on the individual needs. It consists of a keypad and a handle which allows the steering wheel to be controlled with the valid upper limb while allowing easy access to position lights, low and high beam lights, flashing, windscreen wiper (two speeds available), rear electric windscreen wiper, front windscreen washer, direction indicators, hazard lights and horn. Its knob is ergonomic and the position of the keypad can be adjusted on the basis of the customer's preferences. The back-lighting of the buttons can be activated with the pressure of a button. Available in different colours.

The installation of PV1009/R is quick and non-invasive, also on those vehicles with a digital switch gear or with CAN-BUS system, thanks to K-CAN, the new CAN-BUS interface that Kivi has recently achieved.
